Baruch Weinstein

AI Product Builder

Herzliya, Israel · +972 52 648 7274 · burry439@gmail.com · baruchweinstein.com · linkedin.com/in/baruch-weinstein · github.com/Burry439

SUMMARY

AI product builder with full-stack development experience and an MA in Human–Computer Interaction. I take a real user problem, design the AI workflow and the evaluations that check it, and ship a working product by directing AI coding agents (Claude Code, Codex). I teach AI app prototyping as a teaching assistant at Reichman University.

AI PROJECTS

SimReview: AI coaching for paramedic interview practice · simreview.vercel.app 2026 · Live

Solo build · Python, FastAPI, React, TypeScript, Postgres (Neon), Vercel, Render, OpenAI transcription and LLM APIs, FFmpeg

- Built a Hebrew–English pipeline that turns a phone recording of a practice interview into a speaker-separated transcript, OPQRST rubric feedback linked to the exact moment in the recording, a written report and a coaching video.
- Designed a case check that stops grading when the recording doesn't match the selected patient case: 8/8 wrong or unverifiable cases blocked in a 24-transcript benchmark.
- Raised grader agreement with authored rubric labels from 24/40 to 40/40 on a frozen benchmark (8/8 on held-out cases). Calibrated with 12 scripted AI-voiced interviews; 10 landed in their target score band on the first run.
- Compared models per pipeline stage for feedback quality, latency and cost, and kept the rubric arithmetic in code rather than the model. 130+ backend and 50+ browser tests; read-only demo account for reviewers.

The City Beyond: AI-judged time-travel game · github.com/Burry439/time-travel 2026 · Playable prototype

Solo build · Godot 4, Python, SQLite, OpenAI APIs for judging, character dialogue and image generation

- Designed an "AI proposes, code decides" architecture: a model judges each typed invention or action, game code checks the materials and saves the effect, and characters respond from their own memory and knowledge.
- Built replayable evaluation suites: 13/13 initial invention cases passed, including attempts to override the rules; typed intents were understood correctly in 180/189 runs at a 0.29s median, versus 1.7s on the previous route.
- Reviewed 601 logged player attempts to find actions that "succeeded" without changing the game, then added reusable effects for objects, permissions and relationships. Text costs of $0.02–0.07 per session; 500+ automated tests.

EXPERIENCE

Teaching Assistant, Reichman University · Herzliya Oct 2025 – Present

- **Rapid AI Prototyping: Apps & Analytics.** Guide students building AI apps with LLMs, Lovable and Supabase; explain client, server and database concepts and debug their implementations.
- **Rapid Visual Prototyping.** Support Unity setup, C# interaction scripting, and XR, 2D and Arduino prototypes.
- **Seminar: VR Research and Prototyping.** Support students building Unity VR experiences and evaluating them with qualitative and quantitative UX methods.

Full Stack Developer, JumboMail · Tel Aviv Jun 2019 – Mar 2020

- Built features end to end on production web applications (React front end, Node.js and .NET services), fixed user-reported production issues and modernized legacy code.

Full Stack Developer, Red Black Tree · Tel Aviv Oct 2018 – Jun 2019

- Built front-end and back-end features for web applications (React, Node.js, .NET), resolved production bugs and updated legacy code to current practices.

EDUCATION

MA, Human–Computer Interaction · Reichman University 2024 – 2026

All required coursework and credits completed.

BA, Business and Entrepreneurship · Reichman University 2022 – 2024

Full-Stack Web Development Bootcamp · Elevation Academy 2017

SKILLS

AI: LLM applications, AI workflows and agents, prompt design, LLM evaluation and benchmarking, structured outputs, speech-to-text and diarization, OpenAI API

Build: Python, FastAPI, React, TypeScript, JavaScript, Node.js, Postgres, SQLite, Git, Vercel, FFmpeg

AI-assisted development: Claude Code, Codex, Lovable, Supabase

Also: Godot, Unity C#, user research, experimental design, rapid prototyping
